Summary

Staff-level software engineer with a strong track record designing **developer-facing platforms, APIs, and product surfaces** used by both internal teams and external customers. Experienced working fluidly across **front-end product development and shared infrastructure**, with deep hands-on ownership of systems spanning mobile applications, cloud services, data pipelines, and connected devices.

Known for leading ambiguous, cross-cutting initiatives end to end by clarifying requirements, making architectural tradeoffs explicit, and delivering systems that balance **correctness, scalability, and usability**. Particularly motivated by work where high-quality developer experience directly improves product velocity and system reliability.

Experience

Sub-Zero Group, Inc. — Madison, WI

Staff Software Engineer — Mobile, Platform, and Cloud Systems

March 2020 – Present

- Architected and rebuilt the Sub-Zero Group Owner's App from the ground up in Flutter, unifying two legacy native apps (Android + iOS) into a single modern cross-platform codebase.
 - Delivered complete redesign and rewrite between mid-2022 and early-2023.
 - App rating increased from 1 star to 4.5 stars, reflecting significant customer satisfaction gains.
 - Enabled dramatically faster feature development cycles by establishing shared architectural patterns, tooling, and APIs.
 - Achieved sustained month-over-month growth in both total and active users, with nearly every month since launch setting a new all-time record.
- Led full-stack development of the company's new Recipe Experience (2025): conceived and prototyped the concept, designed the UX, built the Flutter front end, and implemented the Azure backend (Functions + Cosmos DB).
 - Built internal content management tools for recipes, plus reporting dashboards tracking engagement and performance.

- Designed and exposed backend APIs consumed by multiple teams and surfaces, prioritizing clarity, evolvability, and safe defaults.
- Drove end-to-end vision, from feature ideation through data analytics—establishing a repeatable model for full-stack innovation.
- Worked closely with legal teams on patentability and freedom to operate analyses.
- Collaborated cross-functionally with design, hardware, and product teams to align connected-appliance UX with brand and user expectations.
- Built internal test tooling, analytics pipelines, and reporting dashboards to improve system observability and developer feedback loops across mobile and cloud teams.

Independent Developer & Technical Writer

2017 – Present

- Authored 60+ in-depth articles on Flutter, Firebase, and Azure architecture, among other miscellaneous topics, on Medium, reaching tens of thousands of readers and influencing best practices in modern Flutter app development.
- Created and published open-source libraries and tools, including:
 - *flutter_splendid_ble* — Designed and maintained a **developer-focused BLE platform abstraction** for Flutter, providing a consistent, well-documented API across iOS and Android.
 - Abstracted divergent platform BLE stacks into a coherent API surface while preserving low-level escape hatches for advanced use cases.
 - Prioritized developer experience through clear lifecycle modeling, predictable error handling, and comprehensive documentation.
 - Used in commercial and research projects; supported as a long-lived, production-grade open-source library.
 - *splendid_cli* — developer productivity CLI for standardizing project structure, automation, and best practices across teams.
- Winner – 2025 Azure AI Developer Hackathon (Microsoft / DevPost) for Copper, an AI-powered tool assisting hardware engineers in debugging printed circuit board designs.
 - Built the complete web platform with Flutter, Azure Functions, and Cosmos DB.
 - Interfaced with Open AI LLM models via Azure AI Services.
 - Developed a KiCad file parser that transforms PCB data for LLM-based analysis, generating actionable feedback via a custom dashboard interface.
 - Treated internal tooling as a product, with clear API boundaries, documentation, and user-facing feedback loops for engineers.

Education

Bachelor of Science in Information Science and Technology

University of Wisconsin, Milwaukee

Graduated: July 2015

My academic efforts towards earning my degree in information science and technology combined computer science, programming, communication, and information architecture coursework.

Awards and Recognition

- Winner — Azure AI Developer Hackathon 2025 (Microsoft / DevPost)
- Sub-Zero Group Owner's App Rating Improvement: 1 star → 4.5 stars
- 60+ Technical Articles Published — Medium (Flutter, Firebase, Azure, AI)

Selected Platform & Developer Tooling Projects

Flutter Splendid BLE — Developer-focused cross-platform BLE abstraction emphasizing API clarity, correctness, and long-term maintainability Splendid CLI — Flutter project automation and scaffolding tool
Copper — AI-assisted PCB analysis platform (Azure Functions, Cosmos DB, LLM integration) Brine — Predictive IoT cooking probe and mobile app (Flutter, Firebase, thermal modeling) Dwellware — Agentic AI household app orchestration (Google Cloud Run, MCP architecture)
